Cat Climb

CAT CLIMB DESIGN PROPOSAL

Course:

2026

Cat Climb

DESIGN STATEMENT

Vertical wall-climb browser game about tension, timing, and playful mastery kept simple. Player sticks to cave walls, leaps the gap, risks mid-air spin slash to cut the monster .Real-time browser input and response is the artwork; without it the piece is only animation.Audience should feel height, agency, and readable risk

every tap are important

- Player decisions directly affect rhythm and level of risk
- Choosing when to jump, slash, or hold creates different exposure
- combine with the tools make each tap meaningful
- You can dash after hitting a monster or cannonball three times.

target audience: all ages who wants to kill time
platform: phone, ipad or pc

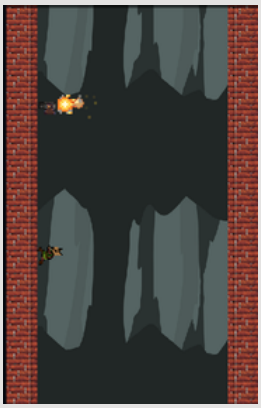

CONCEPT ART

mian charactor

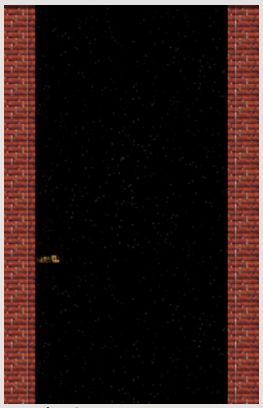

Cat Climb uses pixel art in a portrait 180×320 playfield to sell a wall-climb experience inside a narrow cave: an orange-brown pixel cat runs with feet on the side walls, then leaps the gap on tap/click/space and can risk a mid-air spin slash to cut the monster

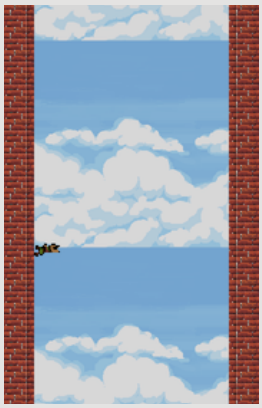

The art direction follows simple 2000–2010 mobile games; interaction rhythm is researched from Ninja Must Die, while the cat, cave fiction, and sprites stay original. without real-time control this would only be linear animation.

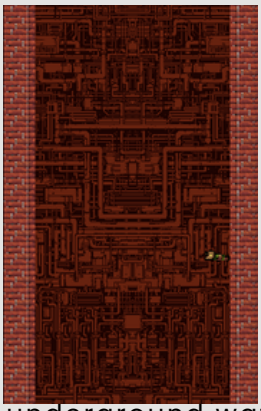

cave

night

sky

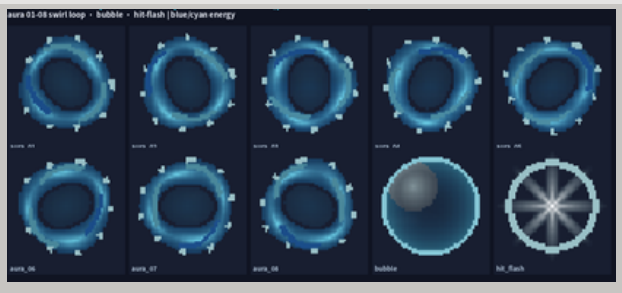

underground water pipe world

cannons

red brick cave walls, silver spikes, and side cannons make height and timing readable at a glance; a cyan swirl shield, slash arcs, muzzle flash, and dash afterimages give instant feedback

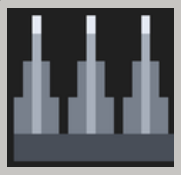

The Concept Art set shows playfield scale, wall-run pose, hazard silhouettes, and VFX so the visual language matches the live input and response loop.

shield

spikes

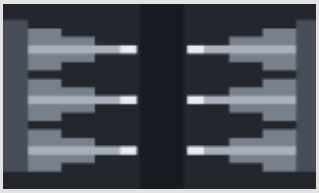

DESIGN PLAN

Tell the AI that the main controls are clicking and pressing the space bar to jump between walls, and that you can perform a spinning slash during the jump to increase player entertainment and interactivity. Also, the camera should be positioned so that the walls on both sides are pointing downwards to create an upward sense of space

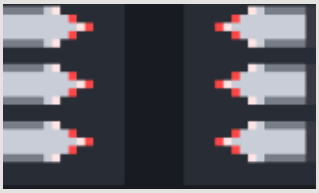

Design process

give reference image to AI → ask AI provide a schematic diagram→ correct &confirm prompt→ send the right prompt to update the game.

items and gameplay improvement :

After

before

After

GAMING RESEARCH

- **Temple Run —** endless run clarity / readable stakes
- **Angry Birds —** one-gesture mastery, simple silhouette
- **Where's My Water —** puzzle clarity with simple goals
- **Doodle Jump —** vertical climb / one-thumb rhythm
- **Ninja Must Die—** run-and-slash timing research only (not visual clone)

INTERACTION AND AUDIENCE EXPERIENCE

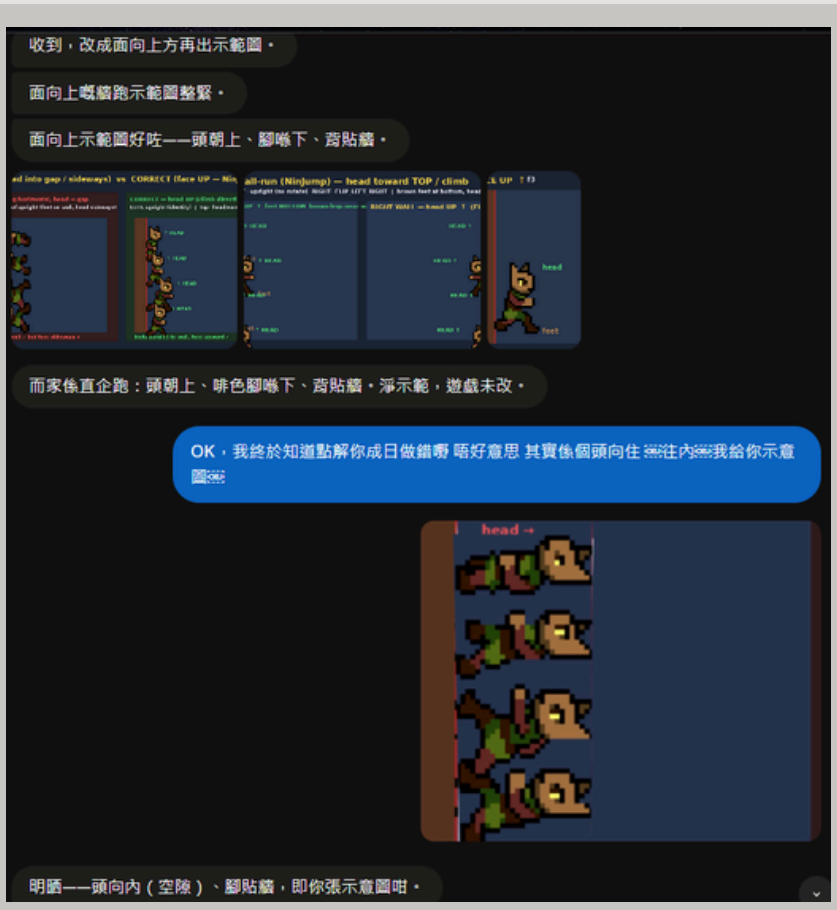

- **One primary control — easy and with one finger : jump timing + slash timing**
- **observe — dodge the cannons & spikes**
- **props— use the tools E.g. dash, shield .etc**
- **Feedback — shield protection, muzzle/hit FX, fail interface**

Audience Experience:

TECHNICAL RESEARCH

I used AI as a design and iteration assistant. It helped me explore looks, poses, and VFX fast; I still draw the charactor or items , tuned spacing in playtests, and decided what shipped.AI is merely an aid (for codeand iteration); the final decision rests with me.

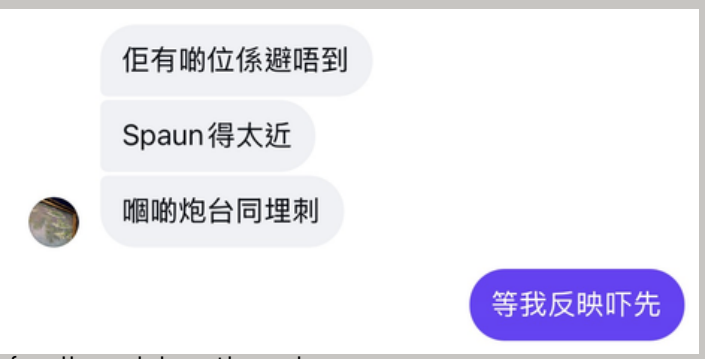

What AI did

- Concept & art direction — Based on my initial draft and description,quick pixel of the cave, cat, spikes, and cannons so AI could choose a readable silhouette early
- **analyze my prompt and my instruction**
- **coding**
- **after turning playtest notes ("cannons too close", "spikes hard to read") into clearer a game**
- **summarizing Technical Research and Concept Art**

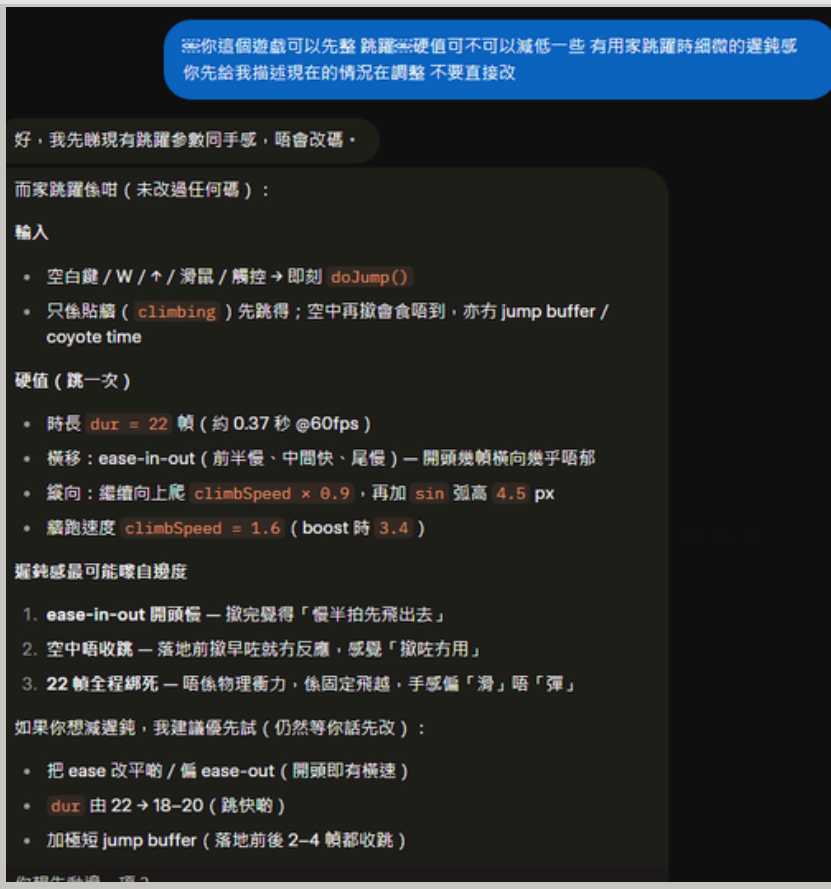

For example, if the jumping controls feel stiff, causing users to fail frequently, I need to query the AI for data and speed up the jump cooldown.

What I did

- **collect the player gaming feedback**
- **analysis with AI and and i need to tell it a exact prompt or comments. i usually will not let the AI correct in the first time**
- **Playtest → change →improvement**

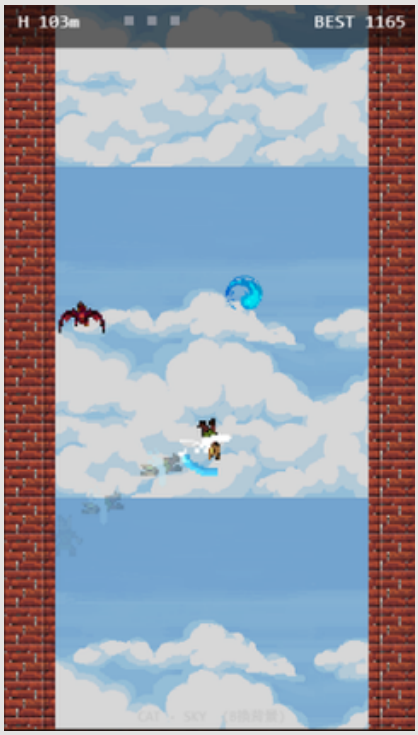

feedbaack by other players

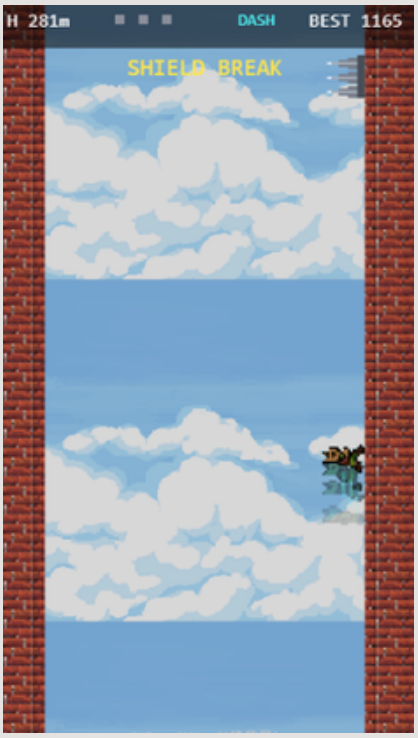

Cat Climb

INPUT → PROCESS → OUTPUT

→

→

Input:

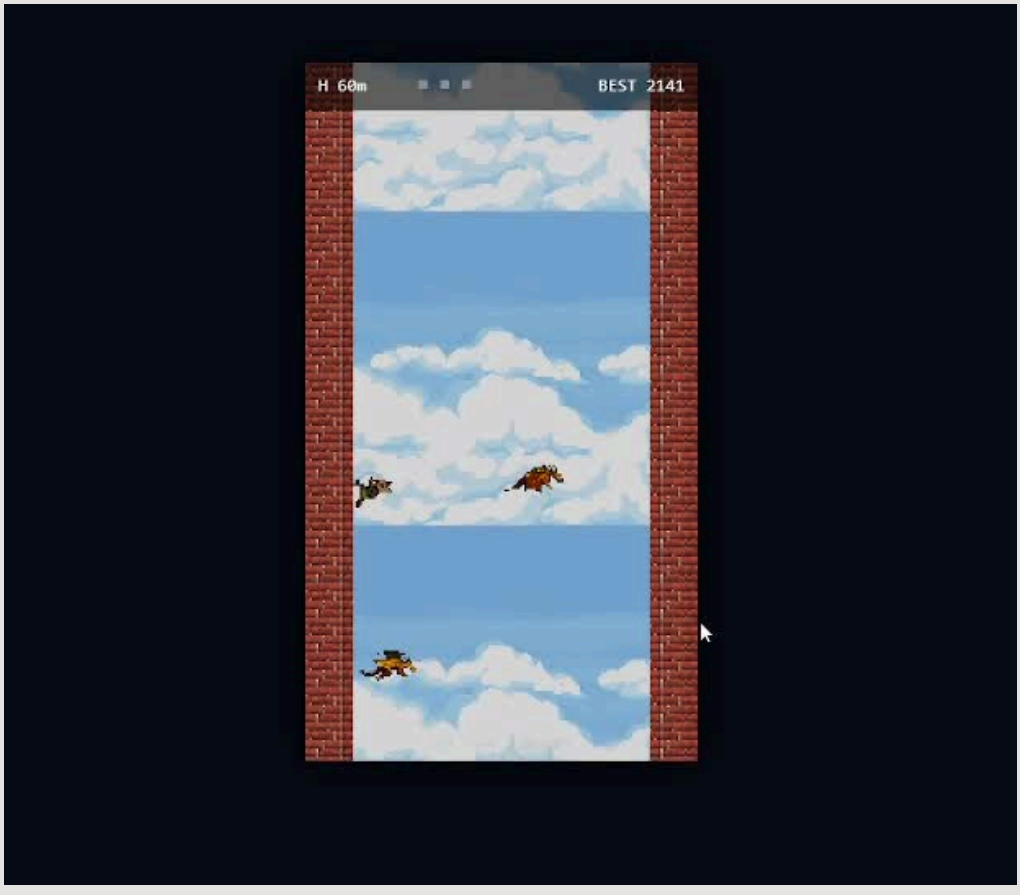

- **tap / click / space to start game and to let the cat jump and slash**

Process:

- **vertical climb + scroll camera; cannons & silver spikes; slashable shots; shield pickups**

Output:

- **jump arc , tools FX ,dodge the obstacle or real-time ranking/failure HUD**

PROCESS, TESTING AND DELIVERABLES

Cat Climb

Concept → art demos → analyze by grok Ai→confirm by my decision→grok Ai coding → playtest → iterate

Playtest & fixes:

- The game had many bugs from the very beginning of development, such as the protagonist's unnatural running movements.
- jump timing was too stiff
- player request a ranking functaion
- Hand in: A 30–60s MP4

after

Credits

- Original content: Gameplay, programming, final art, and level logic
- Tools: HTML/JS/p5.js, GitHub Pages, grok ai
- References: the rhythm of ‘Ninja Must Die’ and 2000s-2010s games
- AI: Only provides coding.the decision of the final version are belongs to me,.
